

Inspection

There's nothing like being there

Manufacturer and project inspections are strongly suggested when building any Specialty Vehicle. Quite simply, they ensure that your project is proceeding as anticipated. SVS conducts thorough inspections with or for you to verify that your project is built to the highest quality standards, both above and below the surface. As an added level value, projects are also inspected for applicable FMVSS, DOT, and ANSI compliance to ensure the safety of your staff and clientele.

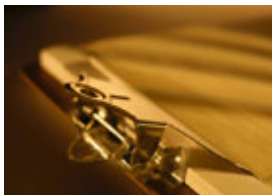

To go over things with a fine-tooth comb

SVS representatives conduct all inspections with a unique depth of perspective and expertise to ensure complete project compliance. Unfortunately, visual inspections just don't tell the whole story. Panels and assemblies must be removed to verify all aspects of the project, and the inspector must be well versed in current construction techniques, structural analysis, and regulatory requirements applicable to the project.

Our team members keep abreast with ever-changing regulations and industry technologies to inspect your project for FMVSS, DOT, MIL-SPEC, NEC and ANSI compliance, as well as full specification adherence and industry best practice. Every project we inspect must conform to our rigorous 172-point inspection checklist before given our respected seal of approval.

Only SVS can provide this level of independent assurance - leading to a successful, mission-critical project that will serve you with years of safe and dependable service.

Count on SVS to inspect your project with the experience gained over many years of experience and training.
